<u>Amendments to the Specification</u>:

Please delete the previous abstract at page 38 and add the following <u>new</u> abstract:

Methods, systems, and products, including computer program products, for streaming video from data storage to a user. The video includes previously-stored first video data and second video data. A request to fast-forward the video is received, and an attempt to bypass the second video data is detected. Notwithstanding the request to fast-forward the video, the second video data is streamed to the user. A storage stack is also presented that includes a virtual partition strategy module configured to ignore a request to fast forward through an advertisement in streaming data.
